SUMMARY

Systems engineer with 6 years building decentralized infrastructure, on-chain protocols, and OS-level software. Most recently CTO at Foundation Protocol where I shipped ERC-4626 vault contracts and fundraise infrastructure. Currently building **kdo** (workspace runtime for AI coding agents) and **kdow** (agentic workflows for non-technical professionals). Side collaborator on **Kanad** at Deeprealm Labs, a quantum chemistry platform. Looking for founding engineer, systems engineer, or CTO seats at AI infrastructure and agent tooling teams.

TECHNICAL SKILLS

Languages: Rust, C, TypeScript, Solidity, Python

AI / Agent Tooling: Model Context Protocol (MCP), Claude API, OpenAI API, agent orchestration, tool use, LLM fine-tuning

Systems: WASM, Linux Kernel Modules, GTK, embedded firmware

Distributed Systems: libp2p, gossipsub, IPC (Interplanetary Consensus), distributed consensus, ZK proofs

Decentralized Storage: Filecoin, IPFS, Forest (Rust implementation), content addressing

Blockchain: Solana (Anchor, @solana/kit, agave), EVM (Foundry, Hardhat)

Web: React, Next.js, WebGL

Tools: Git, Docker, PostgreSQL, Redis

EXPERIENCE

Foundation Protocol · Co-founder / CTO

February 2026 to June 2026

Shipped ERC-4626 vault on Arbitrum with NAV oracle and liquidity buffer. Pivoted to Solana for Compute Yield token-2022 vault programs. Submitted to Colosseum hackathon from Network School with Superteam Malaysia.

Devforce99 · Backend Software Engineer

September 2025 to February 2026

Backend engineering for two MVP launches as part of a high-output dev studio. Shipped backend services and EVM smart contracts for **Prophet**, a token-based prediction platform, then helped extend the system to Solana. Built **SURF** token staking programs and backend infrastructure for **Surfcash**, a payment app for digital nomads that routes Solana stablecoins to local QR codes (the local neobank for people who move).

IPC and PLDG · Working Group Contributor (rust-libp2p and IPC)

April 2025 to September 2025

Contributed to **rust-libp2p** (transport, gossipsub, and peer discovery layers) and the **Interplanetary Consensus (IPC) protocol**, Filecoin's subnet architecture for hierarchical scaling. Worked on consensus design, subnet checkpointing, and cross-subnet messaging primitives. Solved Solana historical retrievals from Filecoin at Filecoin Hacker House.

Wind Network · Co-founder

October 2024 to April 2025

Solana data streaming and archiving consensus network built on libp2p gossipsub. 2nd place at Jito GRID global hackathon. Supported by Superteam and Solana Foundation.

Cubik · Fullstack Engineer

2024

Wallet contexts, modal infrastructure, UI components library, and API integrations.

ShastraOS · Co-founder

March 2021 to July 2024

Co-founded and built an Arch-based Linux distribution with custom package management. Integrated Filecoin and IPFS for decentralized software distribution. Built Rust + GTK system applications for the GNOME desktop. Designed decentralized time-shift backups using content-addressed storage.

NOTABLE PROJECTS

kdo (2026, *ongoing*). Workspace runtime for AI coding agents. Compiles monorepos into agent-readable representations served over MCP. Detects loops, enforces token budgets, integrates with Claude Code, OpenClaw, and any MCP-compatible agent. Evolving into an agent factory that spawns coordinated workers to build a single final product.

kdow (2026, *ongoing*). Sibling to kdo. Smart agentic workflows for non-technical professionals. Brings agent automation to accountants, lawyers, insurance brokers, bankers, teachers, and other knowledge workers who don't code.

Kanad (*side collaboration with Mukul at Deeprealm Labs*). Browser-based, GUI-driven quantum chemistry platform. Lets researchers simulate molecules on real quantum hardware (IBM, IonQ, Rigetti) without writing quantum code. Includes ongoing fine-tuning of Qwen 3.6 35B-A3B for computational molecular dynamics. Deeprealm Labs is building the accessibility layer for quantum chemistry, enabling domain scientists to run simulations on real quantum hardware.

GossipRPC (2024). Novel RPC system over libp2p gossipsub for resilient P2P communication and message broadcasting across decentralized networks.

Chat P2P (2023). Decentralized chat application using Rust, WASM, and Libp2p with secure peer discovery and message routing.

OPEN SOURCE

Forest (Protocol Labs). Contributed to Forest, the Rust implementation of Filecoin.

GNOME Foundation (2021 to 2022). Contributed to GTK components, gnome-web, and GTK-Rust bindings.

FOSSCU (2022 to Present). Lead maintainer for a 300+ member open-source systems community.

EDUCATION

B.Tech Computer Science, IFTM University (2021 to 2025)

ACHIEVEMENTS

Arcium Fellowship 2025

Wormhole Fellowship Program

Solana Hackathon Winner (Solway)

Jito Hackathon Winner (Windexer)

Network School (Forest City, Malaysia) member, May 2026

Active Superteam member
